

Software Requirements Specification (SRS) for Business Management System

This document outlines the requirements for a custom business management software designed for **Khushi Wedding Mall**, specializing in wedding decoration and event supply products [cite: 1]. The system must be intuitive for users with limited formal education.

1. Customer Management

- Ability to create, modify, and store comprehensive customer profiles.
- Generate lists of customers categorized by specific segments (e.g., location, type).

To make the system more efficient, please add the following functionality:

- • Customer Profile: When creating or viewing a customer name, the system must automatically show their current Opening Balance or Closing Balance.
- • Item Profile: When creating or viewing a product name, the system must automatically show the current Stock Quantity available.
-

2. Inventory/Item Management

- **Hierarchical Categorization:** Items must be managed under primary and secondary categories.
 - *Example:* Primary Category "Cloth" contains sub-categories like "Velvet," "Micro," "Lycra."
 - *Example:* Primary Category "Fabrication" contains all iron-based items.
- Full CRUD (Create, Read, Update, Delete) functionality for all inventory items.

3. Sales Workflow

- **Order Form (Tablet Optimized):** A user-friendly interface for mobile tablets to record initial orders.
- **Quotation Generation:** Once an order is finalized, it must transition into a formal quotation.
 - Once a quotation is finalized, it becomes locked and cannot be modified (only cancellable).
- **Billing (Desktop Optimized):** One-click conversion from the finalized quotation to a formal bill.
 - The formats for the Order Form and the final Bill must be distinct.
 - Bills cannot be modified once generated.
- **Financial Summary on Quotation:**
 - Display total quotation amount.

- **Bottom-Left:** Display the customer's previous balance.
 - **Bottom-Right:** Display the sum of previous balance + current bill amount.
- **Parcel Tracking:** Upon saving a bill, the system must prompt the user to input the number of parcels dispatched. This count must be explicitly printed on the final bill (e.g., "3 Parcels Dispatched").

4. Purchase Management (Inward Entry)

The following fields are mandatory for saving an inward entry:

- Bill Number
- Builty Number
- Transport Name
- Vendor Name
- Goods Receive Date
- GST (Manual fixed amount entry, not percentage-based)
- Freight and Forwarding costs
- Discount
- Round Off

5. Finance and Ledger

- **Core Functions:** Include dedicated modules for Sales Return, Purchase Return, Payment Entries, Receipt Entries, and Journal Entries.
- **Integrated Ledger:** Centralized dashboard for each customer displaying all transactions, items purchased, and sales history.
- **Pending Balance Report:** A dedicated filter/list to display only customers with outstanding payment balances.

6. Usability Standards

- **Interface Design:** The UI must be exceptionally simple, utilizing clear icons, large buttons, and minimal text to ensure ease of use for uneducated staff members.

Requirement: Partial Dispatch & Order Management

- **Split Shipments:** The system must support partial dispatches for a single order. If an order consists of multiple items (e.g., Cloth, Carpets, Flower Sticks), the user must be able to select only specific items or quantities to dispatch at any given time.
- **Live Order Tracking:**
 - Items that have been dispatched must be moved to the final **Bill**.
 - Items that have *not* yet been dispatched must remain saved in the original **Order Form**.
- **Automatic Reconciliation:** When generating a final quotation or bill, the system should only pull the items currently being sent from the Order Form. The Order Form should automatically update to show the "Balance Remaining" for each item until the entire order is fulfilled.
